Database Rule Set for MEG and MEI

give me a rule set for all of the rules in these documents for transporting out to a database for my node system
Thought for 24s

Here is a **canon-only, database-ready rule set** distilled from the uploaded documents, with the later scope correction taken into account. The biggest control rule added by the docs themselves is that your ingest should distinguish **locked extracted canon** from **future/deferred conceptual space**, so the database does not give equal weight to unfinished expansions.

```
{
  "project_id": "PROJECT.MEG-MEI.DAVID.PS119",
  "project_title": "MEG & MEI — David's Heart + Psalm 119",

    }
  }
}
```

A few implementation notes for your database:

The **most important transport rule** is this: treat only the completed David / Psalm 119 / ALIGN architecture as **ExtractedCanon**, and store broader things like expanded evil-influence mechanics, motivation structures, Genesis 3 overlays, and larger MEG/MEI universe claims as

DeferredFutureConceptualSpace until separately locked. That correction is explicit in the docs.

The docs also explicitly support your node-system fields of **id, label, type, tags, description, aliases, status, sources**, plus rope fields **from, to, relationship, notes, sources**.

Your canonical tag discipline is also explicit: no tag sprawl, every new tag must map into an existing family, and Psalm 119 must always carry **NotLegalism**.

If you want, I can turn this into a strict SQL table schema next.
